

# Classifying Extensions of Abelian Groups

Nir Elber

June 3, 2022

## Abstract

We use group cohomology to provide some general theory to classify all group extensions of a  $G$ -module  $A$  in the case of an abelian group  $G$ . The main idea is to provide a group presentation of the extension using specially chosen elements of  $A$ .

## 1 General Group Extensions

Throughout this section,  $G$  will be a finite group and  $A$  will be a  $G$ -module; we will write the group operation of  $A$  and the group action of  $G$  on  $A$  multiplicatively. To sketch the idea here, begin with an extension

$$1 \rightarrow A \rightarrow \mathcal{E} \xrightarrow{\pi} G \rightarrow 1.$$

We know that we can abstractly represent  $\mathcal{E}$  as the set  $A \times G$  with some group law dictated by a 2-cocycle in  $H^2(G, A)$ , so we expect that  $\mathcal{E}$  can be presented by  $A$  and a choice of lifts from  $G$ , with some specially chosen relations.

Here are some basic observations realizing this idea. We start by lifting a single element of  $G$ .

**Lemma 1.** Let  $A$  be a  $G$ -module, and let

$$1 \rightarrow A \rightarrow \mathcal{E} \xrightarrow{\pi} G \rightarrow 1$$

denote a group extension. Further, fix some  $\sigma \in G$  of order  $n_\sigma$ , and find  $F \in \mathcal{E}$  such that  $\sigma := \pi(F)$ . Then

$$\alpha := F^{n_\sigma}$$

has  $\alpha \in A^{(\sigma)}$ .

*Proof.* A priori, we only know that  $\alpha \in \mathcal{E}$ , so we compute

$$\pi(\alpha) = \pi(F^{n_\sigma}) = \sigma^{n_\sigma} = 1,$$

so  $\alpha \in \ker \pi = A$ . Thus, we may say that

$$\sigma(\alpha) = F\alpha F^{-1} = F^{n_\sigma} = \alpha,$$

so  $\alpha \in A^{(\sigma)}$ , as desired. ■

We can make the above proof more explicit by specifying the group law of  $\mathcal{E}$ .

**Lemma 2.** Let  $A$  be a  $G$ -module. Picking up some 2-cocycle  $c \in Z^2(G, A)$ , let

$$1 \rightarrow A \rightarrow \mathcal{E} \xrightarrow{\pi} G \rightarrow 1$$

be the corresponding extension. Fixing  $\sigma \in G$  of order  $n_\sigma$ , let  $F := (m, \sigma) \in \mathcal{E}$  be a lift. Then

$$\alpha := F^{n_\sigma} = N_\sigma(m) \prod_{i=0}^{n_\sigma-1} c(\sigma^i, \sigma),$$

where  $N_\sigma := \sum_{i=0}^{n_\sigma-1} \sigma^i$ .

*Proof.* This is a direct computation. By induction, we have that

$$F^k = \left( \prod_{i=0}^{k-1} \sigma^i(m) c(\sigma^i, \sigma), \sigma^k \right)$$

for  $k \in \mathbb{N}$ . Indeed, there is nothing to say for  $k = 0$ , and the inductive step merely expands out  $F^k \cdot F$ . It follows that

$$\alpha = F^{n_\sigma} = \left( \prod_{i=0}^{n_\sigma-1} \sigma^i(m) \cdot \prod_{i=0}^{n_\sigma-1} c(\sigma^i, \sigma), 1 \right),$$

which is what we wanted. ■

Having this explicit formula lets us say how  $\alpha$  changes as we vary the lift.

**Proposition 3.** Let  $A$  be a  $G$ -module. Fixing a cohomology class  $u \in H^2(G, A)$ , let

$$1 \rightarrow A \rightarrow \mathcal{E} \xrightarrow{\pi} G \rightarrow 1$$

be a group extension whose isomorphism class corresponds to  $u$ . Further, fix some  $\sigma \in G$  of order  $n_\sigma$ , and let  $A_\sigma := A^{(\sigma)}$  be the fixed submodule. Then the set

$$S_{\mathcal{E}, \sigma} := \{F^{n_\sigma} : \pi(F) = \sigma\}$$

is an equivalence class in  $A_\sigma / N_\sigma(A)$ , independent of the choice of  $\mathcal{E}$ . Again,  $N_\sigma := \sum_{i=1}^{n_\sigma-1} \sigma^i$ .

*Proof.* Note that  $S_{\mathcal{E},\sigma} \subseteq A_\sigma$  already from [Lemma 1](#).

The point is to use [Lemma 2](#). Note the extension  $\mathcal{E}$  corresponds to the equivalence class  $u \in H^2(G, A)$ , so let  $c \in Z^2(G, A)$  be a representative. Letting  $\mathcal{E}_c$  be the extension constructed from  $c$ , we are promised an isomorphism  $\varphi: \mathcal{E} \simeq \mathcal{E}_c$  making the following diagram commute.

$$\begin{array}{ccccccc} 1 & \longrightarrow & A & \longrightarrow & \mathcal{E} & \xrightarrow{\pi} & G \longrightarrow 1 \\ & & \parallel & & \downarrow \varphi & & \parallel \\ 1 & \longrightarrow & A & \longrightarrow & \mathcal{E}_c & \xrightarrow{\pi_c} & G \longrightarrow 1 \end{array}$$

We start by claiming that  $S_{\mathcal{E},\sigma} = S_{\mathcal{E}_c,\sigma}$ , which will show that  $S_{\mathcal{E},\sigma}$  is independent of the choice of representative  $\mathcal{E}$ . To show  $S_{\mathcal{E},\sigma} \subseteq S_{\mathcal{E}_c,\sigma}$ , note that  $\alpha \in S_{\mathcal{E},\sigma}$  has  $F \in \mathcal{E}$  with  $\pi(F) = \sigma$  and  $\alpha = F^{n_\sigma}$ . Pushing this through  $\varphi$ , we see  $\varphi(F) \in \mathcal{E}_c$  has

$$\pi_c(\varphi(F)) = \varphi(\pi(F)) = \sigma \quad \text{and} \quad \varphi(F)^{n_\sigma} = \varphi(F^{n_\sigma}) = \alpha,$$

so  $\alpha \in S_{\mathcal{E}_c,\sigma}$  follows. An analogous argument with  $\varphi^{-1}$  shows the other needed inclusion.

It thus suffices to show that  $S_{\mathcal{E}_c,\sigma}$  is an equivalence class in  $A_\sigma/N_\sigma(A)$ . However, this is exactly what [Lemma 2](#) says as we let the possible lifts  $F = (m, \sigma) \in \mathcal{E}_c$  of  $\sigma$  vary over  $m \in A$ . ■

The fact that we are taking elements of  $G$  to equivalence classes in  $A_\sigma^\times/N_\sigma(A)$  is reminiscent of the (inverse) Artin reciprocity map, and indeed that is exactly what is going on.

**Corollary 4.** Work in the context of [Proposition 3](#). Then

$$S_\sigma := S_{\mathcal{E},\sigma} = [\sigma] \cup [c],$$

where  $\cup: \hat{H}^{-2}(G, A) \times \hat{H}^2(G, A) \rightarrow \hat{H}^0(G, A)$  is the cup product in Tate cohomology.

*Proof.* Using notation as in the proof of [Proposition 3](#), we recall that  $S_\sigma = S_{\mathcal{E}_c,\sigma}$ , so it suffices to prove the result for  $\mathcal{E}_c$ . Well, by [Lemma 2](#),  $S_\sigma$  is represented by

$$\prod_{i=0}^{n_\sigma-1} c(\sigma^i, \sigma).$$

However, this product is exactly the cup product  $[\sigma] \cup [c]$ . ■

**Corollary 5.** Let  $L/K$  be a finite Galois extension of local fields with Galois group  $G := \text{Gal}(L/K)$ . Further, let

$$1 \rightarrow L^\times \rightarrow \mathcal{E} \xrightarrow{\pi} G \rightarrow 1$$

be an  $L/K$ -gerb bound by  $\mathbb{G}_m$  whose isomorphism class corresponds to the fundamental class  $u_{L/K} \in H^2(G, L^\times)$ . Further, fix some  $\sigma \in G$  of order  $n_\sigma$ , and let  $L_\sigma := L^{\langle \sigma \rangle}$  be the fixed field. Then

$$\theta_{L/L_\sigma}^{-1}(\sigma) = \{F^{n_\sigma} : \pi(F) = \sigma\}.$$

*Proof.* Recalling  $\theta_{L/L_\sigma}^{-1}$  is a cup product map, note that  $\theta_{L/L_\sigma}^{-1}(\sigma)$  is given by  $[\sigma] \cup u_{L/K}$ . So we are done by [Corollary 4](#). ■

The above results are all interested in lifting single elements of  $G$  and studying how they behave on their own. In the discussion that follows, we will need to study how the lifts interact with each other, but for now, we will justify why lifts are adequate to study as follows.

**Proposition 6.** Let  $A$  be a  $G$ -module. Further, let

$$1 \rightarrow A \rightarrow \mathcal{E} \xrightarrow{\pi} G \rightarrow 1$$

be a group extension. Given elements  $\{\sigma_i\}_{i=1}^m$  which generate  $G$ , then  $\mathcal{E}$  is generated by  $A$  and a set of lifts  $\{F_i\}_{i=1}^m$  with  $\pi(F_i) = \sigma_i$  for each  $i$ .

*Proof.* Fix some element  $e \in \mathcal{E}$ , which we need to exhibit as a product of elements in  $A$  and  $F_i$ s. Well, because the  $\sigma_i$  generate  $G$ , we know that  $\pi(e) \in G$  can be written as

$$\pi(e) = \prod_{i=1}^m \sigma_i^{a_i}$$

for some sequence of integers  $\{a_i\}_{i=1}^m$ . It follows that

$$\pi\left(\frac{e}{\prod_{i=1}^m F_i^{a_i}}\right) = 1,$$

so  $\frac{e}{\prod_{i=1}^m F_i^{a_i}} = \ker \pi = A$ . Thus, we can find some  $x \in A$  such that

$$e = x \cdot \prod_{i=1}^m F_i^{a_i},$$

which is what we wanted. ■

## 2 Abelian Group Extensions

### 2.1 Extensions to Tuples

The above proofs technically don't even require that the group  $G$  is abelian. If we want to keep track of the fact our group is abelian, we should extract the elements of  $A$  which can do so.

**Lemma 7.** Let  $A$  be a  $G$ -module, and let

$$1 \rightarrow A \rightarrow \mathcal{E} \xrightarrow{\pi} G \rightarrow 1$$

be a group extension. Further, fix some  $F_1, F_2 \in \mathcal{E}$  and define  $\sigma_i := \pi(F_i)$  for  $i \in \{1, 2\}$ , and let  $\sigma_i \in G$  have order  $n_i$ . Then, setting

$$\alpha_i := F_i^{n_i} \quad \text{and} \quad \beta := F_1 F_2 F_1^{-1} F_2^{-1},$$

we have the following.

- (a)  $\alpha_i \in A^{\langle \sigma_i \rangle}$  for  $i \in \{1, 2\}$  and  $\beta \in A$ .
- (b)  $N_1(\beta) = \alpha_1 / \sigma_2(\alpha_1)$  and  $N_2(\beta^{-1}) = \alpha_2 / \sigma_1(\alpha_2)$ , where  $N_i := \sum_{p=0}^{n_i-1} \sigma_i^p$ .

*Proof.* These checks are a matter of force. For brevity, we set  $A_i := A^{\langle \sigma_i \rangle}$  for  $i \in \{1, 2\}$ .

- (a) That  $\alpha_i \in A_i$  follows from [Lemma 1](#). Lastly,  $\beta \in A$  follows from noting

$$\pi(\beta) = \pi(F_1)\pi(F_2)\pi(F_1)^{-1}\pi(F_2)^{-1} = 1,$$

so  $\beta \in \ker \pi = A$ .

(b) We will check that  $N_{L/L_1}(\beta) = \alpha_1/\sigma_2(\alpha_1)$ ; the other equality follows symmetrically after switching 1s and 2s because  $\beta^{-1} = F_2 F_1 F_2^{-1} F_1^{-1}$ . Well, we compute

$$\begin{aligned}
 N_1(\beta) &= \sigma_1^{-1}(\beta) \cdot \sigma_1^{-2}(\beta) \cdot \sigma^{-3} \cdot \dots \cdot \sigma^{-n_1}(\beta) \\
 &= F_1^{-1} (F_1 F_2 F_1^{-1} F_2^{-1}) F_1 \\
 &\quad \cdot F_1^{-2} (F_1 F_2 F_1^{-1} F_2^{-1}) F_1^2 \\
 &\quad \cdot F_1^{-3} (F_1 F_2 F_1^{-1} F_2^{-1}) F_1^3 \cdot \dots \\
 &\quad \cdot F_1^{-n_1} (F_1 F_2 F_1^{-1} F_2^{-1}) F_1^{n_1} \\
 &= F_2 F_1^{-1} \\
 &\quad \cdot F_1^{-1} \\
 &\quad \cdot F_1^{-1} \cdot \dots \\
 &\quad \cdot F_1^{-1} F_2^{-1} F_1^{n_1} \\
 &= F_2 F_1^{-n_1} F_2^{-1} F_1^{n_1} \\
 &= \alpha_1/\sigma_2(\alpha_1).
 \end{aligned}$$

The above computations finish the proof. ■

The proof of (b) above might appear magical, but in fact it comes from a more general idea.

**Lemma 8.** Fix everything as in Lemma 7. Then, for  $x, y \geq 0$ , we have

$$F_1^x F_2^y = \prod_{k=0}^{x-1} \prod_{\ell=0}^{y-1} \sigma_1^k \sigma_2^\ell(\beta) F_2^y F_1^x.$$

*Proof.* We induct. We take a moment to write out the case of  $x = 1$ , for which we induct on  $y$ . To be explicit, we will prove

$$F_1 F_2^y = \prod_{\ell=0}^{y-1} \sigma_2^\ell(\beta) F_2^y F_1.$$

For  $y = 0$ , there is nothing to say. So suppose the statement for  $y$  (and  $x = 1$ ), and we show  $y + 1$  (and  $x = 1$ ). Well, we compute

$$\begin{aligned}
 F_1 F_2^{y+1} &= F_1 F_2^y \cdot F_2 \\
 &= \prod_{\ell=0}^{y-1} \sigma_2^\ell(\beta) F_2^y F_1 \cdot F_2 \\
 &= \prod_{\ell=0}^{y-1} \sigma_2^\ell(\beta) F_2^y \beta F_2 F_1 \\
 &= \prod_{\ell=0}^{y-1} \sigma_2^\ell(\beta) \cdot \sigma_2^y(\beta) F_2^y \cdot F_2 F_1 \\
 &= \prod_{\ell=0}^{(y+1)-1} \sigma_2^\ell(\beta) \cdot F_2^{y+1} F_1,
 \end{aligned}$$

which is what we wanted.

We now move on to the general case. We will induct on  $y$ . Note that  $y = 0$  makes the product empty, leaving us with  $F_1^x = F_1^x$ , for any  $x$ . So suppose that the statement is true for some  $y \geq 0$ , and we will show

$y + 1$ . For this, we now turn to inducting on  $x$ . For  $x = 0$ , we note that the product is once again empty, so we are left with showing  $F_2^{y+1} = F_2^{y+1}$ , which is true.

To finish, we suppose the statement for  $x$  and show the statement for  $x + 1$ . Well, we compute

$$\begin{aligned}
F_1^{x+1} F_2^{y+1} &= F_1 \cdot F_1^x F_2^{y+1} \\
&= F_1 \cdot \prod_{k=0}^{x-1} \prod_{\ell=0}^{(y+1)-1} \sigma_1^k \sigma_2^\ell(\beta) \cdot F_2^{y+1} F_1^x \\
&= \sigma_1 \left( \prod_{k=0}^{x-1} \prod_{\ell=0}^{(y+1)-1} \sigma_1^k \sigma_2^\ell(\beta) \right) \cdot F_1 F_2^{y+1} F_1^x \\
&= \prod_{k=1}^{(x+1)-1} \prod_{\ell=0}^{(y+1)-1} \sigma_1^k \sigma_2^\ell(\beta) \cdot F_1 F_2^{y+1} F_1^x \\
&= \prod_{k=1}^{(x+1)-1} \prod_{\ell=0}^{(y+1)-1} \sigma_1^k \sigma_2^\ell(\beta) \cdot \prod_{\ell=0}^{(y+1)-1} \sigma_2^\ell(\beta) \cdot \sigma_2^y(\beta) \cdot F_2^{y+1} F_1 \cdot F_1^x \\
&= \prod_{k=0}^{(x+1)-1} \prod_{\ell=0}^{(y+1)-1} \sigma_1^k \sigma_2^\ell(\beta) F_2^{y+1} F_1^{x+1},
\end{aligned}$$

which is what we wanted. ■

**Remark 9.** Setting  $x = n_1$  and  $y = 1$  recovers  $N_{L/L^{\langle \sigma_1 \rangle}}(\beta) = \alpha_1 / \sigma_2(\alpha_1)$ .

In particular, Remark 9 tells us that coherence of the group law in  $\mathcal{E}$  should give rise to relations between our elements of  $A$ . Here is a more complex example.

**Lemma 10.** Let  $A$  be a  $G$ -module, and let

$$1 \rightarrow A \rightarrow \mathcal{E} \xrightarrow{\pi} G \rightarrow 1$$

be a group extension. Further, fix some  $F_1, F_2, F_3 \in \mathcal{E}$  and define  $\sigma_i := \pi(F_i)$  for  $i \in \{1, 2, 3\}$ , and let  $\sigma_i \in G$  have order  $n_i$ . Then, setting

$$\beta_{ij} := F_i F_j F_i^{-1} F_j^{-1}$$

for each pair of indices  $(i, j)$  with  $i > j$ . Then

$$\frac{\sigma_2(\beta_{31})}{\beta_{31}} = \frac{\sigma_1(\beta_{32})}{\beta_{32}} \cdot \frac{\sigma_3(\beta_{21})}{\beta_{21}}.$$

*Proof.* The point is to turn  $F_3 F_2 F_1$  into  $F_1 F_2 F_3$  in two different ways. On one hand,

$$\begin{aligned}
(F_3 F_2) F_1 &= \beta_{32} F_2 F_3 F_1 \\
&= \beta_{32} F_2 \beta_{31} F_1 F_3 \\
&= \beta_{32} \sigma_2(\beta_{31}) (F_2 F_1) F_3 \\
&= \beta_{32} \sigma_2(\beta_{31}) \beta_{21} F_1 F_2 F_3.
\end{aligned}$$

On the other hand,

$$\begin{aligned}
 F_3(F_2F_1) &= F_3\beta_{21}F_1F_2 \\
 &= \sigma_3(\beta_{21})(F_3F_1)F_2 \\
 &= \sigma_3(\beta_{21})\beta_{31}F_1(F_3F_2) \\
 &= \sigma_3(\beta_{21})\beta_{31}F_1\beta_{32}F_2F_3 \\
 &= \sigma_3(\beta_{21})\beta_{31}\sigma_1(\beta_{32})F_1F_2F_3.
 \end{aligned}$$

Thus,

$$\beta_{32}\sigma_2(\beta_{31})\beta_{21} = \sigma_3(\beta_{21})\beta_{31}\sigma_1(\beta_{32}),$$

which rearranges into the desired equation. ■

**Remark 11.** The relation from [Lemma 10](#) may look asymmetric in the  $\beta_{ij}$ , but this is because the definitions of the  $\beta_{ij}$ s themselves are asymmetric in  $F_i$ .

## 2.2 Tuples to Cocycles

### 2.2.1 The Set-Up

The proceeding lemma is intended to give intuition that the element  $\beta$  is helping to specify the group law on  $\mathcal{E}$ .

More concretely, we will take the following set-up for the following results: fix a  $G$ -module  $A$ , and let

$$1 \rightarrow A \rightarrow \mathcal{E} \rightarrow G \rightarrow 1$$

be a group extension. Once we choose elements  $\{\sigma_i\}_{i=1}^m$  generating  $G$ , we know by [Proposition 6](#) that we can generate  $\mathcal{E}$  by  $A$  and some arbitrarily chosen lifts  $\{F_i\}_{i=1}^m$  of the  $\{\sigma_i\}_{i=1}^m$ . Then, letting  $n_i$  be the order of  $\sigma_i$ , we set

$$\alpha_i := F_i^{n_i}$$

for each index  $i$  and

$$\beta_{ij} := F_i F_j F_i^{-1} F_j^{-1}$$

for each index  $1 \leq j < i \leq m$ . Notably, we will not need more  $\beta$ s: indeed,  $\beta_{ii} = 1$  and  $\beta_{ij} = \beta_{ji}^{-1}$  for any  $i$  and  $j$ . Setting  $A_i := A^{\langle \sigma_i \rangle}$  and  $N_i := \sum_{p=0}^{n_i-1} \sigma_i^p$ , the story so far is that

$$\alpha_i \in A_i \text{ for each } i \quad \text{and} \quad \beta_{ij} \in A \text{ for each } i > j \tag{2.1}$$

and

$$N_i(\beta_{ij}) = \alpha_i / \sigma_j(\alpha_i) \quad \text{and} \quad N_j(\beta_{ij}^{-1}) = \alpha_j / \sigma_i(\alpha_j) \quad \text{for each } i > j \tag{2.2}$$

by [Lemma 7](#), and

$$\frac{\sigma_j(\beta_{ik})}{\beta_{ik}} = \frac{\sigma_k(\beta_{ij})}{\beta_{ij}} \cdot \frac{\sigma_i(\beta_{jk})}{\beta_{jk}} \quad \text{for each } i > j > k \tag{2.3}$$

by [Lemma 10](#). This data is so important that we will give it a name.

**Definition 12.** In the above set-up, the data of  $(\{\alpha_i\}, \{\beta_{ij}\})$  satisfying (2.1) and (2.2) and (2.3) will be called a  $\{\sigma_i\}_{i=1}^m$ -tuple. When understood, the  $\{\sigma_i\}_{i=1}^m$  will be abbreviated.

Note that this definition is independent of  $\mathcal{E}$ , but a choice of extension  $\mathcal{E}$  and lifts  $F_i$  give a  $\{\sigma_i\}_{i=1}^m$ -tuple as described above.

**Remark 13.** The set of  $\{\sigma_i\}_{i=1}^m$ -tuples form a group under multiplication in  $A$ . Indeed, the conditions (2.1) and (2.2) and (2.3) are closed under multiplication and inversion.

We also know from Lemma 8 that

$$F_i^x F_j^y = \prod_{k=0}^{x-1} \prod_{\ell=0}^{y-1} \sigma_i^k \sigma_j^\ell (\beta_{ij}) F_j^y F_i^x$$

for  $i > j$  and  $x, y \geq 0$ . It will be helpful to have some notation for the residue term in  $A$ , so we define

$$\beta_{ij}^{(k\ell)} := \prod_{k=0}^{x-1} \prod_{\ell=0}^{y-1} \sigma_i^k \sigma_j^\ell (\beta_{ij}).$$

Now, combined with the fact that  $F_i x = \sigma_i(x) F_i$  for each  $F_i$  and  $x \in A$ , we have been approximately told how the group operation works in  $\mathcal{E}$ . Namely, we could conceivably write any element of  $\mathcal{E}$  in the form

$$x F_1^{a_1} \dots F_m^{a_m}$$

for  $x \in A$  and  $a_i \in \mathbb{Z}/n_i \mathbb{Z}$  because we know how to make these elements commute and generate  $\mathcal{E}$ . Further, we can multiply out two terms of the form

$$x F_1^{a_1} \dots F_m^{a_m} \cdot y F_1^{b_1} \dots F_m^{b_m}$$

into a term of the form  $z F_1^{c_1} \dots F_m^{c_m}$ . In fact, it will be helpful for us to see how to do this.

**Proposition 14.** Fix everything as in the set-up, except drop the assumption that  $\{\sigma_i\}_{i=1}^m$  generate  $G$ . Then, choosing  $a_i, b_i \in \mathbb{N}$  for each  $i$ , we have

$$\left( \prod_{i=1}^m F_i^{a_i} \right) \left( \prod_{i=1}^m F_i^{b_i} \right) = \left[ \prod_{1 \leq j < i \leq m} \left( \prod_{1 \leq k < j} \sigma_k^{a_k + b_k} \right) \left( \prod_{j \leq k < i} \sigma_k^{a_k} \right) \beta_{ij}^{(a_i b_j)} \right] \left( \prod_{i=1}^m F_i^{a_i + b_i} \right).$$

*Proof.* The reason that we dropped the assumption on  $\{\sigma_i\}_{i=1}^m$  is so that we may induct directly on  $m$ . We start by showing that

$$\left( \prod_{i=1}^m F_i^{a_i} \right) F_1^{b_1} = \left[ \prod_{1 < i \leq m} \left( \prod_{1 \leq k < i} \sigma_k^{a_k} \right) \beta_{i1}^{(a_i b_1)} \right] F_1^{a_1 + b_1} \prod_{i=2}^m F_i^{a_i}.$$

We do this by induction on  $m$ . When  $m = 0$  and even for  $m = 1$ , there is nothing to say. For the inductive step, we assume

$$\left( \prod_{i=1}^m F_i^{a_i} \right) F_1^{b_1} = \left[ \prod_{1 < i \leq m} \left( \prod_{1 \leq k < i} \sigma_k^{a_k} \right) \beta_{i1}^{(a_i b_1)} \right] F_1^{a_1 + b_1} \prod_{i=2}^m F_i^{a_i}$$

and compute

$$\begin{aligned} \left( \prod_{i=1}^{m+1} F_i^{a_i} \right) F_1^{b_1} &= \left( \prod_{i=1}^m F_i^{a_i} \right) F_{m+1}^{a_{m+1}} F_1^{b_1} \\ &= \left( \prod_{i=1}^m F_i^{a_i} \right) \beta_{m+1,1}^{(a_{m+1} b_1)} F_1^{b_1} F_{m+1}^{a_{m+1}} \\ &= \left[ \left( \prod_{k=1}^m \sigma_k^{a_k} \right) \beta_{m+1,1}^{(a_{m+1} b_1)} \right] \left[ \prod_{1 < i \leq m} \left( \prod_{1 \leq k < i} \sigma_k^{a_k} \right) \beta_{i1}^{(a_i b_1)} \right] F_1^{a_1 + b_1} \left( \prod_{i=2}^m F_i^{a_i} \right) F_{m+1}^{a_{m+1}} \\ &= \left[ \prod_{1 < i \leq m+1} \left( \prod_{1 \leq k < i} \sigma_k^{a_k} \right) \beta_{i1}^{(a_i b_1)} \right] F_1^{a_1 + b_1} \left( \prod_{i=2}^{m+1} F_i^{a_i} \right), \end{aligned}$$

which completes our inductive step.

We now attack the statement of the proposition directly, again inducting on  $m$ . For  $m = 0$  and even for  $m = 1$ , there is again nothing to say. For the inductive step, take  $m > 1$ , and we get to assume that

$$\left( \prod_{i=2}^m F_i^{a_i} \right) \left( \prod_{i=2}^m F_i^{b_i} \right) = \left[ \prod_{2 \leq j < i \leq m} \left( \prod_{2 \leq k < j} \sigma_k^{a_k + b_k} \right) \left( \prod_{j \leq k < i} \sigma_k^{a_k} \right) \beta_{ij}^{(a_i b_j)} \right] \left( \prod_{i=2}^m F_i^{a_i + b_i} \right).$$

From here, we can compute

$$\begin{aligned} \left( \prod_{i=1}^m F_i^{a_i} \right) \left( \prod_{i=1}^m F_i^{b_i} \right) &= \left( \prod_{i=1}^m F_i^{a_i} \right) F_1^{b_1} \left( \prod_{i=2}^m F_i^{b_i} \right) \\ &= \left[ \prod_{1 < i \leq m} \left( \prod_{1 \leq k < i} \sigma_k^{a_k} \right) \beta_{i1}^{(a_i b_1)} \right] F_1^{a_1 + b_1} \left( \prod_{i=2}^m F_i^{a_i} \right) \left( \prod_{i=2}^m F_i^{b_i} \right) \\ &= \left[ \prod_{1 < i \leq m} \left( \prod_{1 \leq k < i} \sigma_k^{a_k} \right) \beta_{i1}^{(a_i b_1)} \right] F_1^{a_1 + b_1} \cdot \\ &\quad \left[ \prod_{2 \leq j < i \leq m} \left( \prod_{2 \leq k < j} \sigma_k^{a_k + b_k} \right) \left( \prod_{j \leq k < i} \sigma_k^{a_k} \right) \beta_{ij}^{(a_i b_j)} \right] \left( \prod_{i=2}^m F_i^{a_i + b_i} \right) \\ &= \left[ \prod_{1 < i \leq m} \left( \prod_{1 \leq k < i} \sigma_k^{a_k} \right) \beta_{i1}^{(a_i b_1)} \right] \cdot \\ &\quad \sigma_1^{a_1 + b_1} \left[ \prod_{2 \leq j < i \leq m} \left( \prod_{2 \leq k < j} \sigma_k^{a_k + b_k} \right) \left( \prod_{j \leq k < i} \sigma_k^{a_k} \right) \beta_{ij}^{(a_i b_j)} \right] \left( \prod_{i=2}^m F_i^{a_i + b_i} \right). \end{aligned}$$

From here, a little rearrangement finishes the inductive step. ■

The reason we exerted this pain upon ourselves is for the following result.

**Proposition 15.** Fix everything as in the set-up. Then, if well-defined, we can represent the cohomology class corresponding to  $\mathcal{E}$  by the cocycle

$$c(g, h) := \left[ \prod_{1 \leq j < i \leq m} \left( \prod_{1 \leq k < j} \sigma_k^{a_k + b_k} \right) \left( \prod_{j \leq k < i} \sigma_k^{a_k} \right) \beta_{ij}^{(a_i b_j)} \right] \left[ \prod_{i=1}^m \left( \prod_{1 \leq k < i} \sigma_k^{a_k + b_k} \right) \alpha_i^{\left\lfloor \frac{a_i + b_i}{n_i} \right\rfloor} \right],$$

where  $g = \prod_i \sigma_i^{a_i}$  and  $h = \prod_i \sigma_i^{b_i}$ .

Observe that [Proposition 15](#) has a fairly strong hypothesis that  $c$  is well-defined; we will return to this later.

*Proof.* Very quickly, we use the division algorithm to define

$$a_i + b_i = n_i q_i + r_i$$

where  $q_i \in \{0, 1\}$  and  $0 \leq r_i < n_i$ . In particular,

$$gh = \prod_{i=1}^m F_i^{r_i}.$$

Now, because the elements  $\sigma_i$  generate  $G$ , we see that the lifts  $\sigma_i \mapsto F_i$  defines a section  $s: G \rightarrow \mathcal{E}$ . As such, we can compute a representing cocycle for our cohomology class as

$$\begin{aligned} c(g, h) &= s(g)s(h)s(gh)^{-1} \\ &= \left( \prod_{i=1}^m F_i^{a_i} \right) \left( \prod_{i=1}^m F_i^{b_i} \right) \left( \prod_{i=1}^m F_i^{r_i} \right)^{-1} \\ &= \left[ \prod_{1 \leq j < i \leq m} \left( \prod_{1 \leq k < j} \sigma_k^{a_k + b_k} \right) \left( \prod_{j \leq k < i} \sigma_k^{a_k} \right) \beta_{ij}^{(a_i b_j)} \right] \left( \prod_{i=1}^m F_i^{a_i + b_i} \right) \left( \prod_{i=1}^m F_{m-i+1}^{-r_{m-i+1}} \right). \end{aligned}$$

It remains to deal with the last products; we claim that it is equal to

$$\left( \prod_{i=1}^m F_i^{a_i + b_i} \right) \left( \prod_{i=1}^m F_{m-i+1}^{-r_{m-i+1}} \right) = \prod_{i=1}^m \left( \prod_{1 \leq k < i} \sigma_k^{a_k + b_k} \right) \alpha_i^{q_i},$$

which will finish the proof. We induct on  $m$ ; for  $m = 0$  and  $m = 1$ , there is nothing to say. For the inductive step, we assume that

$$\left( \prod_{i=2}^m F_i^{a_i + b_i} \right) \left( \prod_{i=1}^{m-1} F_{m-i+1}^{-r_{m-i+1}} \right) = \prod_{i=2}^m \left( \prod_{2 \leq k < i} \sigma_k^{a_k + b_k} \right) \alpha_i^{q_i}$$

and compute

$$\begin{aligned} \left( \prod_{i=1}^m F_i^{a_i + b_i} \right) \left( \prod_{i=1}^m F_{m-i+1}^{-r_{m-i+1}} \right) &= F_1^{a_1 + b_1} \left( \prod_{i=2}^m F_i^{a_i + b_i} \right) \left( \prod_{i=1}^{m-1} F_{m-i+1}^{-r_{m-i+1}} \right) F_1^{-a_1 - b_1} F_1^{a_1 + b_1 - r_1} \\ &= F_1^{a_1 + b_1} \left( \prod_{i=2}^m \left( \prod_{2 \leq k < i} \sigma_k^{a_k + b_k} \right) \alpha_i^{q_i} \right) F_1^{-a_1 - b_1} \alpha_1^{q_1} \\ &= \left( \prod_{i=2}^m \left( \prod_{1 \leq k < i} \sigma_k^{a_k + b_k} \right) \alpha_i^{q_i} \right) \alpha_1^{q_1} \\ &= \prod_{i=1}^m \left( \prod_{1 \leq k < i} \sigma_k^{a_k + b_k} \right) \alpha_i^{q_i}, \end{aligned}$$

finishing. ■

### 2.2.2 The Modified Set-Up

A priori we have no reason to expect that the  $c$  constructed in [Proposition 15](#) is actually a cocycle, especially if the  $\sigma_i$  have nontrivial relations.

To account for this, we modify our set-up slightly. By the classification of finitely generated abelian groups, we may write

$$G \simeq \bigoplus_{k=1}^m G_k,$$

where  $G_k \subseteq G$  with  $G_k \cong \mathbb{Z}/n_k\mathbb{Z}$  and  $n_k > 1$  for each  $n_k$ . As such, we let  $\sigma_k$  be a generating element of  $G_k$  so that we still know that the  $\sigma_k$  generate  $G$ . In this case, we have the following result.

**Theorem 16.** Fix everything as in the modified set-up, forgetting about the extension  $\mathcal{E}$ . Then a  $\{\sigma_i\}_{i=1}^m$ -tuple of  $\{\alpha_i\}_{i=1}^m$  and  $\{\beta_{ij}\}_{i>j}$  makes

$$c(g, h) := \left[ \prod_{1 \leq j < i \leq m} \left( \prod_{1 \leq k < j} \sigma_k^{a_k + b_k} \right) \left( \prod_{j \leq k < i} \sigma_k^{a_k} \right) \beta_{ij}^{(a_i b_j)} \right] \left[ \prod_{i=1}^m \left( \prod_{1 \leq k < i} \sigma_k^{a_k + b_k} \right) \alpha_i^{\left\lfloor \frac{a_i + b_i}{n_i} \right\rfloor} \right],$$

where  $g := \prod_i \sigma_i^{a_i}$  with  $h := \prod_i \sigma_i^{b_i}$  and  $0 \leq a_i, b_i < n_i$ , into a cocycle in  $Z^2(G, A)$ .

*Proof.* Note that  $c$  is now surely well-defined because the elements  $g$  and  $h$  have unique representations as described. Anyway, we relegate the cocycle check to [Appendix A](#) because it is long, annoying, and unenlightening. ■

Observe that the above construction has now completely forgotten about  $\mathcal{E}$ ! Namely, we have managed to go from tuples straight to cocycles; this is theoretically good because it will allow us to go fully in reverse: we will be able to start with a tuple, build the corresponding cocycle, from which the extension arises. However, equivalence classes of cocycles give the “same” extension, so we will also need to give equivalence classes for tuples as well.

## 2.3 Building Tuples

We continue in the modified set-up of the previous section. There is already an established way to get from a cocycle to an extension, which means that it should be possible to go straight from the cocycle to a  $\{\sigma_i\}_{i=1}^m$ -tuple. Again, it will be beneficial to write this out.

**Lemma 17.** Fix everything as in the modified set-up, but suppose that  $\mathcal{E} = \mathcal{E}_c$  is the extension generated from a cocycle  $c \in Z^2(G, A)$ . Then, if  $F_i = (x_i, \sigma_i)$  are our lifts, we have

$$\alpha_i = N_i(x_i) \cdot \prod_{k=0}^{n_i-1} c(\sigma_i^k, \sigma_i) \quad \text{and} \quad \beta_{ij} = \frac{x_i}{\sigma_j(x_i)} \cdot \frac{\sigma_i(x_j)}{x_j} \cdot \frac{c(\sigma_i, \sigma_j)}{c(\sigma_j, \sigma_i)}$$

for each  $\alpha_i$  and  $\beta_{ij}$ .

*Proof.* The equality for the  $\alpha_i$  follow from [Lemma 2](#). For the equality about  $\beta_{ij}$ , we simply compute by brute force, writing

$$\begin{aligned} F_i F_j &= (x_i \cdot \sigma_i x_j \cdot c(\sigma_i, \sigma_j), \sigma_i \sigma_j) \\ F_j F_i &= (x_j \cdot \sigma_j x_i \cdot c(\sigma_j, \sigma_i), \sigma_j \sigma_i) \\ (F_j F_i)^{-1} &= ((\sigma_j \sigma_i)^{-1} (x_j \cdot \sigma_j x_i \cdot c(\sigma_j, \sigma_i))^{-1}, \sigma_i^{-1} \sigma_j^{-1}), \end{aligned}$$

which gives

$$\begin{aligned} \beta_{ij} &= (F_i F_j)(F_j F_i)^{-1} \\ &= \left( \frac{x_i}{\sigma_j x_i} \cdot \frac{\sigma_i x_j}{x_j} \cdot \frac{c(\sigma_i, \sigma_j)}{c(\sigma_j, \sigma_i)}, 1 \right), \end{aligned}$$

finishing. ■

Here is a nice sanity check that we are doing things in the right setting: not only can we build tuples from extensions, but we can find an extension corresponding to any tuple.

**Corollary 18.** Fix everything as in the modified set-up, forgetting about the extension  $\mathcal{E}$ . For any  $\{\sigma_i\}_{i=1}^m$ -tuple of  $\{\alpha_i\}_{i=1}^m$  and  $\{\beta_{ij}\}_{i>j}$ , there exists an extension  $\mathcal{E}$  and lifts  $F_i$  of the  $\sigma_i$  so that

$$\alpha_i = F_i^{n_i} \quad \text{and} \quad \beta_{ij} = F_i F_j F_i^{-1} F_j^{-1}.$$

*Proof.* From [Theorem 16](#), we may build the cocycle  $c \in Z^2(G, A)$  defined by

$$c(g, h) := \left[ \prod_{1 \leq j < i \leq m} \left( \prod_{1 \leq k < j} \sigma_k^{a_k + b_k} \right) \left( \prod_{j \leq k < i} \sigma_k^{a_k} \right) \beta_{ij}^{(a_i b_j)} \right] \left[ \prod_{i=1}^m \left( \prod_{1 \leq k < i} \sigma_k^{a_k + b_k} \right) \alpha_i^{\lfloor \frac{a_i + b_i}{n_i} \rfloor} \right], \quad (2.4)$$

where  $g := \prod_i F_i^{a_i}$  and  $h := \prod_i F_i^{b_i}$  and  $0 \leq a_i, b_i < n_i$ . As such, we use  $\mathcal{E} := \mathcal{E}_c$  to be the corresponding extension and  $F_i := (1, \sigma_i)$  as our lifts. We have the following checks.

- To show  $\alpha_i = F_i^{n_i}$ , we use [Lemma 17](#) to compute  $F_i^{n_i}$ , which means we want to compute

$$\prod_{k=0}^{n_i-1} c(\sigma_i^k, \sigma_i).$$

Well, plugging  $c(\sigma_i^k, \sigma_i)$  into (2.4), we note that all  $\beta_{k\ell}^{(a_k b_\ell)}$  terms vanish (either  $a_k = 0$  or  $b_\ell = 0$  for each  $k \neq \ell$ ), so the big left product completely vanishes.

As for the right product, the only term we have to worry about is

$$\left( \prod_{1 \leq k < i} \sigma_k^{0+0} \right) \alpha_i^{\lfloor \frac{k+1}{n_i} \rfloor},$$

which is equal to 1 when  $k \leq n_i - 1$  and  $\alpha_i$  when  $k = n_i - 1$ . As such, we do indeed have  $\alpha_i = F_i^{n_i}$ .

- To show  $\beta_{ij} = F_i F_j F_i^{-1} F_j^{-1}$  for  $i > j$ , we again use [Lemma 17](#) to compute  $F_i F_j F_i^{-1} F_j^{-1}$ , which means we want to compute

$$\frac{c(\sigma_i, \sigma_j)}{c(\sigma_j, \sigma_i)}.$$

Plugging into (2.4) once more, there is no way to make  $\lfloor (a_k + b_k)/n_k \rfloor$  nonzero (recall we set  $n_k > 1$  for each  $k$ ) in either  $c(\sigma_i, \sigma_j)$  or  $c(\sigma_j, \sigma_i)$ . As such, the right-hand product term disappears.

As for the left product, we note that it still vanishes for  $c(\sigma_j, \sigma_i)$  because  $i > j$  implies that either  $a_k = 0$  or  $b_\ell = 0$  for each  $k > \ell$ . However, for  $c(\sigma_i, \sigma_j)$ , we do have  $a_i = 1$  and  $b_j = 1$  only, so we have to deal with exactly the term

$$\left( \prod_{1 \leq k < j} \sigma_k^{a_k + b_k} \right) \left( \prod_{j \leq k < i} \sigma_k^{a_k} \right) \beta_{ij}.$$

With  $i > j$  and  $a_k = b_k = 0$  for  $k \notin \{i, j\}$ , we see that the product of all the  $\sigma_k$ s will disappear, indeed only leaving us with  $\beta_{ij}$ .

The above computations complete the proof. ■

And here is our first taste of (partial) classification.

**Corollary 19.** Fix everything as in the modified set-up, forgetting about the extension  $\mathcal{E}$ . Then the formula of [Theorem 16](#) and the formulae of [Lemma 17](#) (setting  $x_i = 1$  for each  $i$ ) are homomorphisms of abelian groups between the set of  $\{\sigma_i\}_{i=1}^m$ -tuples and cocycles in  $Z^2(G, A)$ . In fact, the formula of [Theorem 16](#) is a section of the formulae of [Lemma 17](#).

*Proof.* The formulae in [Theorem 16](#) and [Lemma 17](#) are both large products in their inputs, so they are multiplicative (i.e., homomorphisms). It remains to check that we have a section. Well, starting with a  $\{\sigma_i\}_{i=1}^m$ -tuple and building the corresponding cocycle  $c$  by [Theorem 16](#), the proof of [Corollary 18](#) shows that the formulae of [Lemma 17](#) recovers the correct  $\{\sigma_i\}_{i=1}^m$ -tuple. ■

## 2.4 Equivalence Classes of Tuples

We continue in the modified set-up. We would like to make [Corollary 19](#) into a proper isomorphism of abelian groups, but this is not feasible; for example, the cocycle  $c$  generated by [Theorem 16](#) will always have  $c(\sigma_j, \sigma_i) = 1$  for  $i > j$ , which is not true of all cocycles in  $Z^2(G, A)$ .

However, we did have a notion that the data of a  $\{\sigma_i\}_{i=1}^m$  should be enough to specify the group law of the extension that the tuple comes from, so we do expect to be able to define all extensions—and hence achieve all cohomology classes—from a specially chosen  $\{\sigma_i\}_{i=1}^m$ -tuple.

To make this precise, we want to define an equivalence relation on tuples which go to the same cohomology class and then show that the map [Theorem 16](#) is surjective on these equivalence classes. The correct equivalence relation is taken from [Lemma 17](#).

**Definition 20.** Fix everything as in the modified set-up. We say that two  $\{\sigma_i\}_{i=1}^m$ -tuples  $(\{\alpha_i\}, \{\beta_{ij}\})$  and  $(\{\alpha'_i\}, \{\beta'_{ij}\})$  are *equivalent* if and only if there exist elements  $x_1, \dots, x_m \in A$  such that

$$\alpha_i = N_i(x_i) \cdot \prod_{k=0}^{n_i-1} c(\sigma_i^k, \sigma_i) \quad \text{and} \quad \beta_{ij} = \frac{x_i}{\sigma_j(x_i)} \cdot \frac{\sigma_i(x_j)}{x_j} \cdot \frac{c(\sigma_i, \sigma_j)}{c(\sigma_j, \sigma_i)}$$

for each  $\alpha_i$  and  $\beta_{ij}$ . We may notate this by  $(\{\alpha_i\}, \{\beta_{ij}\}) \sim (\{\alpha'_i\}, \{\beta'_{ij}\})$ .

This notion of equivalence can be seen to be the correct one in the sense that it correctly generalizes [Proposition 3](#).

**Proposition 21.** Fix everything as in the modified set-up with an extension  $\mathcal{E}$ . As the lifts  $F_i$  change, the corresponding values of

$$\alpha_i := F_i^{n_i} \quad \text{and} \quad \beta_{ij} := F_i F_j F_i^{-1} F_j^{-1}$$

go through a full equivalence class of  $\{\sigma_i\}_{i=1}^m$ -tuples.

*Proof.* We proceed as in [Proposition 3](#). Given an extension  $\mathcal{E}'$ , let  $S_{\mathcal{E}'}$  be the set of  $\{\sigma_i\}_{i=1}^m$ -tuples generated as the lifts  $F_i$  change. We start by showing that an isomorphism  $\varphi: \mathcal{E} \simeq \mathcal{E}'$  of extensions implies that  $S_{\mathcal{E}} = S_{\mathcal{E}'}$ ; by symmetry, it will be enough for  $S_{\mathcal{E}} \subseteq S_{\mathcal{E}'}$ . The isomorphism induces the following diagram.

$$\begin{array}{ccccccc} 1 & \longrightarrow & A & \longrightarrow & \mathcal{E} & \xrightarrow{\pi} & G \longrightarrow 1 \\ & & \parallel & & \downarrow \varphi & & \parallel \\ 1 & \longrightarrow & A & \longrightarrow & \mathcal{E}' & \xrightarrow{\pi'} & G \longrightarrow 1 \end{array}$$

To show that  $S_{\mathcal{E}} \subseteq S_{\mathcal{E}'}$ , pick up some  $\{\sigma_i\}_{i=1}^m$ -tuple  $(\{\alpha_i\}, \{\beta_{ij}\})$  generated from lifts  $F_i \in \mathcal{E}$  (i.e.,  $\pi(F_i) = \sigma_i$ ), where

$$\alpha_i := F_i^{n_i} \quad \text{and} \quad \beta_{ij} := F_i F_j F_i^{-1} F_j^{-1}.$$

Now, we note that  $F'_i := \varphi(F_i)$  will have

$$\pi(F'_i) = \pi(\varphi(F_i)) = \varphi(\pi(F_i)) = \sigma_i$$

by the commutativity of the diagram, so the  $F'_i$  are lifts of the  $\sigma_i$ . Further, we see that

$$(F'_i)^{n_i} = \varphi(F_i)^{n_i} = \varphi(F_i^{n_i}) = \varphi(\alpha_i) = \alpha_i$$

for each  $i$ , and

$$F'_i F'_j (F'_i)^{-1} (F'_j)^{-1} = \varphi(F_i F_j F_i^{-1} F_j^{-1}) = \varphi(\beta_{ij}) = \beta_{ij}$$

for each  $i > j$ . Thus,  $(\{\alpha_i\}, \{\beta_{ij}\})$  is a  $\{\sigma_i\}_{i=1}^m$ -tuple generated by lifts from  $\mathcal{E}'$ , implying that  $(\{\alpha_i\}, \{\beta_{ij}\}) \in S_{\mathcal{E}'}$ .

It now suffices to show the statement in the proposition for a specific extension isomorphic to  $\mathcal{E}$ . Well, the isomorphism class of  $\mathcal{E}$  corresponds to some cohomology class in  $H^2(G, A)$ , for which we let  $c$  be a

representative; then  $\mathcal{E} \simeq \mathcal{E}_c$ , so we may show the statement for  $\mathcal{E} := \mathcal{E}_c$ . Indeed, as the lifts  $F_i = (x_i, \sigma_i)$  change, we know by [Lemma 17](#) that

$$\alpha_i = N_i(x_i) \cdot \prod_{k=0}^{n_i-1} c(\sigma_i^k, \sigma_i) \quad \text{and} \quad \beta_{ij} = \frac{x_i}{\sigma_j(x_i)} \cdot \frac{\sigma_i(x_j)}{x_j} \cdot \frac{c(\sigma_i, \sigma_j)}{c(\sigma_j, \sigma_i)}$$

for each  $\alpha_i$  and  $\beta_{ij}$ . All of these live in the same equivalence class by definition of the equivalence, and as the  $x_i$  are allowed to vary over all of  $A$ , they will fill up that equivalence class fully. This finishes. ■

We are now ready to upgrade our section.

**Corollary 22.** Fix everything as in the modified set-up, forgetting about the extension  $\mathcal{E}$ . Fixing a cohomology class  $[c] \in H^2(G, A)$ , the set of  $\{\sigma_i\}_{i=1}^m$  which correspond to  $[c]$  (via [Theorem 16](#)) forms exactly one equivalence class.

*Proof.* We show that two tuples are equivalent if and only if their corresponding cocycles (via [Theorem 16](#)) to the same cohomology class, which will be enough.

In one direction, suppose  $(\{\alpha_i\}, \{\beta_{ij}\}) \sim (\{\alpha'_i\}, \{\beta'_{ij}\})$ . By [Corollary 18](#), we can find an extension  $\mathcal{E}$  which gives  $(\{\alpha_i\}, \{\beta_{ij}\})$  by choosing an appropriate set of lifts. By [Proposition 21](#), we see that  $(\{\alpha'_i\}, \{\beta'_{ij}\})$  must also come from choosing an appropriate set of lifts in  $\mathcal{E}$ . However, the cocycles in  $Z^2(G, A)$  generated by [Theorem 16](#) from our two tuples now both represent the isomorphism class of  $\mathcal{E}$  by [Proposition 15](#), so these cocycles belong to the same cohomology class.

In the other direction, name the cocycles corresponding to  $(\{\alpha_i\}, \{\beta_{ij}\})$  and  $(\{\alpha'_i\}, \{\beta'_{ij}\})$  by  $c$  and  $c'$  respectively, and suppose  $[c] = [c']$ . Then  $\mathcal{E}_c \simeq \mathcal{E}_{c'}$  as extensions, but we know by the proof of [Corollary 18](#) that  $(\{\alpha_i\}, \{\beta_{ij}\})$  comes from choosing lifts of  $\mathcal{E}_c$  and similar for  $(\{\alpha'_i\}, \{\beta'_{ij}\})$ . In particular, because  $\mathcal{E}_c \simeq \mathcal{E}_{c'}$ , we know that  $(\{\alpha'_i\}, \{\beta'_{ij}\})$  will also come from choosing some lifts in  $\mathcal{E}_c$  (recall the proof of [Proposition 21](#)), so  $(\{\alpha_i\}, \{\beta_{ij}\}) \sim (\{\alpha'_i\}, \{\beta'_{ij}\})$  follows. ■

**Theorem 23.** The maps described in [Corollary 19](#) descend to an isomorphism of abelian groups between the equivalence classes of  $\{\sigma_i\}_{i=1}^m$ -tuples and cohomology classes in  $H^2(G, A)$ .

*Proof.* The fact that the maps are well-defined (in both directions) and hence injective is [Corollary 22](#). The fact that we had a section from tuples to cocycles implies that the map from cocycles to tuples was also surjective. Thus, we have a bona fide isomorphism. ■

## 2.5 Classification of Extensions

We remark that we are now able to classify all extensions up to isomorphism, in some sense. At a high level, an isomorphism class of extensions corresponds to a particular cohomology class in  $H^2(G, A)$ , so choosing a  $\{\sigma_i\}_{i=1}^m$ -tuple  $(\{\alpha_i\}, \{\beta_{ij}\})$  corresponding to this class, we can write out a representative of this cocycle by [Theorem 16](#), properly corresponding to the original extension by [Proposition 15](#).

In fact, the cocycle in [Proposition 15](#) is generated by the description of the group law in [Proposition 14](#), and the entire computation only needed to use the following relations, for the appropriate choice of lifts  $F_i$ .

- (a)  $F_i x = \sigma_i(x) F_i$  for each  $i$  and  $x \in A$ .
- (b)  $F_i^{n_i} = \alpha_i$  for each  $i$ .
- (c)  $F_i F_j F_i^{-1} F_j^{-1} = \beta_{ij}$  for each  $i > j$ ; i.e.,  $F_i F_j = \beta_{ij} F_j F_i$ .

As such, the above relations fully describe the extension because they also specify the cocycle, and we know that this cocycle is well-defined. We summarize this discussion into the following theorem.

**Theorem 24.** Fix everything as in the modified set-up, forgetting about the extension  $\mathcal{E}$ . Given a  $\{\sigma_i\}_{i=1}^m$ -tuple  $(\{\alpha_i\}, \{\beta_{ij}\})$ , define the group  $\mathcal{E}(\{\alpha_i\}, \{\beta_{ij}\})$  as being generated by  $A$  and elements  $\{F_i\}_{i=1}^m$  having the following relations.

- (a)  $F_i x = \sigma_i(x) F_i$  for each  $i$  and  $x \in A$ .
- (b)  $F_i^{n_i} = \alpha_i$  for each  $i$ .
- (c)  $F_i F_j = \beta_{ij} F_j F_i$  for each  $i > j$ .

Then the natural embedding  $A \hookrightarrow \mathcal{E}(\{\alpha_i\}, \{\beta_{ij}\})$  and projection  $\pi: \mathcal{E}(\{\alpha_i\}, \{\beta_{ij}\}) \twoheadrightarrow G$  by  $F_i \mapsto \sigma_i$  makes  $\mathcal{E}(\{\alpha_i\}, \{\beta_{ij}\})$  into an extension. In fact, all extensions are isomorphic to some  $\mathcal{E}(\{\alpha_i\}, \{\beta_{ij}\})$ .

*Proof.* This follows from the preceding discussion, though we will provide a few more words in this proof. The exactness of

$$1 \rightarrow A \rightarrow \mathcal{E}(\{\alpha_i\}, \{\beta_{ij}\}) \xrightarrow{\pi} G \rightarrow 1$$

follows quickly. Further, the action of conjugation of  $\mathcal{E}$  on  $A$  corresponds correctly to the  $G$ -action by (a). So we do indeed have an extension.

It remains to show that all extensions are isomorphic to one of this type. Well, note that [Proposition 14](#) and [Proposition 15](#) use only the above relations to write down a cocycle representing the isomorphism class of  $\mathcal{E}(\{\alpha_i\}, \{\beta_{ij}\})$ , and it is the cocycle corresponding to the  $\{\sigma_i\}_{i=1}^m$ -tuple  $(\{\alpha_i\}, \{\beta_{ij}\})$  itself as described in [Theorem 16](#).

However, we know that as the equivalence class of  $(\{\alpha_i\}, \{\beta_{ij}\})$  changes, we will hit all cohomology classes in  $H^2(G, A)$  by [Theorem 23](#). Thus, because every extension is represented by some cohomology class, every extension will be isomorphic to some  $\mathcal{E}(\{\alpha_i\}, \{\beta_{ij}\})$ . This completes the proof. ■

### 3 Studying Tuples

The story so far has been able to generalize the one-variable results from [section 1](#) to results using all generators of an abelian group in [section 2](#). It remains to prove [Theorem 16](#), which is the main goal of this section.

#### 3.1 Set-Up and Overview

The approach here will be to attempt to abstract our data away from the  $G$ -module  $A$  as much as possible. To set up our discussion, we continue with

$$G \simeq \bigoplus_{i=1}^m G_i,$$

where  $G_i = \langle \sigma_i \rangle \subseteq G$  and  $\sigma_i$  has order  $n_i$ . These variables allow us to define

$$T_i := (\sigma_i - 1) \quad \text{and} \quad N_i := \sum_{p=0}^{n_i-1} \sigma_i^p$$

for each index  $i$ . In fact, it will be helpful to also have notation

$$\sigma^{(a)} := \sum_{p=0}^{a-1} \sigma^p$$

for any  $\sigma \in G$  and nonnegative integer  $a \geq 0$ ; in particular,  $\sigma^{(0)} = 0$  and  $\sigma_i^{(n_i)} = N_i$ . The main benefits to this notation will be the facts that

$$\sigma^{(a+b)} = \sigma^{(a)} + \sigma^a \sigma^{(b)} \quad \text{and} \quad \sigma_i^a = T_i \sigma_i^{(a)} + 1,$$

which can be seen by direct expansion. Given  $g \in \prod_{p=1}^n \sigma_p^{a_p}$ , we will also define the notation

$$g_i := \prod_{p=1}^{i-1} \sigma_p^{a_p}$$

for  $i \geq 0$ . In particular  $g_0 = g_1 = 1$  and  $g_{n+1} = g$ .

Now, our tool in the proof of [Theorem 16](#) will be the magical map  $\mathcal{F}: \mathbb{Z}[G]^m \times \mathbb{Z}[G]^{\binom{m}{2}} \rightarrow \mathbb{Z}[G]^m$  defined by

$$\mathcal{F}: ((x_i)_{i=1}^m, (y_{ij})_{i>j}) \mapsto \left( x_i N_i - \sum_{j=1}^{i-1} y_{ij} T_i + \sum_{j=i+1}^m y_{ji} T_j \right)_{i=1}^m.$$

This is of course a  $G$ -module homomorphism. We will go ahead and state the main results we will prove. Roughly speaking,  $\mathcal{F}$  is manufactured to make the following result true.

**Lemma 25.** Fix everything as above. Then the function

$$\bar{c}(g) := \left( g_i \sigma_i^{(a_i)} \right)_{i=1}^m,$$

where  $g := \prod_{i=1}^m \sigma_i^{a_i}$ , is a 1-cocycle in  $Z^1(G, \text{coker } \mathcal{F})$ .

The reason we care about this cocycle is that we can pass it through a boundary morphism induced by the short exact sequence

$$0 \rightarrow \underbrace{\frac{\mathbb{Z}[G]^m \times \mathbb{Z}[G]^{\binom{m}{2}}}{\ker \mathcal{F}}}_{X:=} \xrightarrow{\mathcal{F}} \mathbb{Z}[G]^m \rightarrow \text{coker } \mathcal{F} \rightarrow 0,$$

so we have a 2-cocycle  $\delta(\bar{c}) \in Z^2(G, X)$ ; in fact, we will be able to explicitly compute  $\delta(\bar{c})$  as a result of the proof of [Lemma 25](#).

Only now will we bring in tuples. The first result provides an alternate description of tuples.

**Lemma 26.** Fix everything as above, and now let  $A$  be a  $G$ -module. Then  $\{\sigma_i\}_{i=1}^m$ -tuples are canonically isomorphic to  $\text{Hom}_{\mathbb{Z}[G]}(X, A)$ . In fact, equivalence classes of  $\{\sigma_i\}_{i=1}^m$ -tuples are canonically isomorphic to  $\hat{H}^0(G, \text{Hom}_{\mathbb{Z}}(X, A))$ .

The second result brings in the last ingredient, the cup product.

**Theorem 27.** Fix everything as above. Further, fix a  $G$ -module  $A$  and a  $\{\sigma_i\}_{i=1}^m$ -tuple  $(\{\alpha_i\}, \{\beta_{ij}\})$ . Then observe there is a natural cup product map

$$\cup: \hat{H}^2(G, X) \times \hat{H}^0(G, \text{Hom}_{\mathbb{Z}}(X, A)) \rightarrow \hat{H}^2(G, A)$$

by using the evaluation map  $X \otimes_{\mathbb{Z}} \text{Hom}_{\mathbb{Z}}(X, A) \rightarrow A$ . Then, using the isomorphism of [Lemma 26](#), the cocycle defined in [Theorem 16](#) is simply the output of  $\delta(\bar{c}) \cup (\{\alpha_i\}, \{\beta_{ij}\})$  on cocycles.

Because we know that the cup product sends cocycles to cocycles, this will show that the cocycle of [Theorem 16](#) is in fact well-defined.

### 3.2 A Cocycle

We continue in the set-up of the previous subsection. The goal of this subsection is to prove [Lemma 25](#). This is a matter of brute force. Set  $c \in C^1(G, \mathbb{Z}[G]^m)$  defined by

$$c(g) := \left( g_i \sigma_i^{(a_i)} \right)_{i=1}^m,$$

where  $g := \prod_{i=1}^m \sigma_i^{a_i}$ . We will show that  $\text{im } dc \subseteq \text{im } \mathcal{F}$ , which we will mean that  $\text{im } \overline{dc} = \text{im } d\bar{c} = 0$ , where  $f \mapsto \bar{f}$  is the map  $C^\bullet(G, \mathbb{Z}[G]^m) \rightarrow C^\bullet(G, \text{coker } \mathcal{F})$  induced by modding out.

As such, we set  $g := \prod_{i=1}^m \sigma_i^{a_i}$  and  $h := \prod_{i=1}^m \sigma_i^{b_i}$  with  $0 \leq a_i, b_i < n_i$  for each  $i$ . Then, using the division algorithm, write

$$a_i + b_i = n_i q_i + r_i$$

where  $q_i \in \{0, 1\}$  and  $0 \leq r_i < n_i$  for each  $i$ . Now, we want to show  $dc(g, h) \in \text{im } \mathcal{F}$ , so we begin by writing

$$\begin{aligned} dc(g, h) &= gc(h) - c(gh) + c(g) \\ &= g \left( h_i \sigma_i^{(b_i)} \right)_{i=1}^m - \left( \prod_{p=0}^{i-1} \sigma_p^{r_p} \cdot \sigma_i^{(r_i)} \right)_{i=1}^m + \left( g_i \sigma_i^{(a_i)} \right)_{i=1}^m \\ &= \left( gh_i \sigma_i^{(b_i)} \right)_{i=1}^m - \left( g_i h_i \sigma_i^{(r_i)} \right)_{i=1}^m + \left( g_i \sigma_i^{(a_i)} \right)_{i=1}^m. \end{aligned} \quad (3.1)$$

We now go term-by-term in (3.1). The easiest is the middle term of (3.1), for which we write

$$\begin{aligned} g_i h_i \sigma_i^{(r_i)} &= g_i h_i \sigma_i^{(a_i+b_i)} - g_i h_i \sigma_i^{r_i} \sigma_i^{(n_i q_i)} \\ &= g_i h_i \sigma_i^{(a_i+b_i)} - g_i h_i \sigma_i^{a_i+b_i} \cdot q_i N_i \\ &= g_i h_i \sigma_i^{(a_i+b_i)} - g_i h_i \cdot q_i N_i, \end{aligned}$$

where the last equality is because  $\sigma_i N_i = N_i$ . Thus,

$$\begin{aligned} - \left( g_i h_i \sigma_i^{(r_i)} \right)_{i=1}^m &= - \left( g_i h_i \sigma_i^{(a_i+b_i)} \right)_{i=1}^m + (g_i h_i \cdot q_i N_i)_{i=1}^m \\ &= - \left( g_i h_i \sigma_i^{(a_i+b_i)} \right)_{i=1}^m + \mathcal{F}((g_i h_i q_i)_i, (0)_{i>j}). \end{aligned}$$

Now, for the left and right terms of (3.1), we will need the following lemma.

**Lemma 28.** Fix everything as in the set-up. Then, given  $g := \prod_{i=1}^m \sigma_i^{a_i}$ , we have

$$g_i = 1 + \sum_{p=1}^{i-1} g_p \sigma_p^{(a_p)} T_p$$

for  $i \geq 1$ .

*Proof.* This is by induction. For  $i = 1$ , there is nothing to say. For the inductive step, we take  $i > 1$  where we may assume the statement for  $i - 1$ . Via some relabeling, we may make our inductive hypothesis assert

$$\prod_{p=2}^{i-1} \sigma_p^{a_p} = 1 + \sum_{p=2}^{i-1} \left( \prod_{q=2}^{p-1} \sigma_q^{a_q} \right) \sigma_p^{(a_p)} T_p.$$

In particular, multiplying through by  $\sigma_1^{a_1}$  yields

$$\begin{aligned} g_i &= \sigma_1^{a_1} \cdot \prod_{p=2}^{i-1} \sigma_p^{a_p} \\ &= \sigma_1^{a_1} + \sigma_1^{a_1} \sum_{p=2}^{i-1} \left( \prod_{q=2}^{p-1} \sigma_q^{a_q} \right) \sigma_p^{(a_p)} T_p \\ &= \sigma_1^{a_1} + \sum_{p=2}^{i-1} g_p \sigma_p^{(a_p)} T_p \\ &= 1 + \sigma_1^{(a_1)} T_1 + \sum_{p=2}^{i-1} g_p \sigma_p^{(a_p)} T_p, \end{aligned}$$

which is exactly what we wanted, after a little more rearrangement. ■

Thus, for the left term of (3.1), the  $i$ th coordinate is

$$\begin{aligned}
 gh_i\sigma_i^{(b_i)} &= g_i\sigma_i^{a_i}\left(\prod_{j=i+1}^{n_2}\sigma_j^{a_j}\right)h_i\sigma_i^{(b_i)} \\
 &= g_i\left(1 + \sum_{j=i+1}^{n_2}\left(\prod_{q=i+1}^{j-1}\sigma_q^{a_q}\right)\sigma_j^{(a_j)}T_j\right)h_i\sigma_i^{a_i}\sigma_i^{(b_i)} \\
 &= g_ih_i\sigma_i^{a_i}\sigma_i^{(b_i)} + \sum_{j=i+1}^{n_2}\left(g_i\sigma_i^{a_i}\prod_{q=i+1}^{j-1}\sigma_q^{a_q}\right)h_i\sigma_j^{(a_j)}\sigma_i^{(b_i)}T_j \\
 &= g_ih_i\sigma_i^{a_i}\sigma_i^{(b_i)} + \sum_{j=i+1}^{n_2}g_jh_i\sigma_j^{(a_j)}\sigma_i^{(b_i)}T_j.
 \end{aligned}$$

And lastly, for the right term of (3.1), the  $i$ th coordinate is

$$\begin{aligned}
 g_i\sigma_i^{(a_i)} &= g_i\left(h_i - \sum_{j=1}^{i-1}h_j\sigma_j^{(b_j)}T_j\right)\sigma_i^{(a_i)} \\
 &= g_ih_i\sigma_i^{(a_i)} - \sum_{j=1}^{i-1}g_ih_j\sigma_i^{(a_i)}\sigma_j^{(b_j)}T_j.
 \end{aligned}$$

So to finish, we continue from (3.1), which gives

$$\begin{aligned}
 dc(g, h) - \mathcal{F}((g_ih_iq_i)_i, (0)_{i>j}) &= \left(g_ih_i\sigma_i^{a_i}\sigma_i^{(b_i)}\right)_{i=1}^m - \left(g_ih_i\sigma_i^{(a_i+b_i)}\right)_{i=1}^m + \left(g_ih_i\sigma_i^{(a_i)}\right)_{i=1}^m \\
 &\quad + \left(\sum_{j=i+1}^{n_2}g_jh_i\sigma_j^{(a_j)}\sigma_i^{(b_i)}T_j - \sum_{j=1}^{i-1}g_ih_j\sigma_i^{(a_i)}\sigma_j^{(b_j)}T_j\right)_{i=1}^m \\
 &= \left(-\sum_{j=1}^{i-1}g_ih_j\sigma_i^{(a_i)}\sigma_j^{(b_j)}T_j + \sum_{j=i+1}^{n_2}g_jh_i\sigma_j^{(a_j)}\sigma_i^{(b_i)}T_j\right)_{i=1}^m \\
 &= \mathcal{F}\left((0)_i, (g_ih_j\sigma_i^{(a_i)}\sigma_j^{(b_j)})_{i>j}\right).
 \end{aligned}$$

Thus,

$$dc(g, h) = \mathcal{F}\left((g_ih_iq_i)_i, (g_ih_j\sigma_i^{(a_i)}\sigma_j^{(b_j)})_{i>j}\right) \in \text{im } \mathcal{F}. \quad (3.2)$$

This completes the proof of Lemma 25.

In fact, the above proof has found an explicit element  $z$  so that  $\mathcal{F}(z) = dc(g, h)$  for each  $g, h \in G$ . As such, we recall that we set

$$X := \frac{\mathbb{Z}[G]^m \times \mathbb{Z}[G]^{\binom{m}{2}}}{\ker \mathcal{F}}$$

to give the short exact sequence

$$0 \rightarrow X \xrightarrow{\mathcal{F}} \mathbb{Z}[G]^m \rightarrow \text{coker } \mathcal{F} \rightarrow 0.$$

In particular, we can track  $\bar{c} \in Z^1(G, \text{coker } \mathcal{F})$  through a boundary morphism: we already have a chosen lift  $c \in Z^1(G, \mathbb{Z}[G]^m)$  for  $\bar{c}$ , and we have also computed  $\mathcal{F}^{-1} \circ dc$  from the above work. This gives the following result.

**Corollary 29.** Fix everything as in the set-up. Then the  $\bar{c}$  of [Lemma 25](#) has

$$\delta(c)(g, h) := \left( (g_i h_i q_i)_i, (g_i h_j \sigma_i^{(a_i)} \sigma_j^{(b_j)})_{i > j} \right) \in Z^2(G, X)$$

where  $\delta$  is induced by

$$0 \rightarrow X \xrightarrow{\mathcal{F}} \mathbb{Z}[G]^m \rightarrow \text{coker } \mathcal{F} \rightarrow 0.$$

*Proof.* This follows from tracking how  $\delta$  behaves, using [\(3.2\)](#). ■

**Remark 30.** In some sense, this  $\delta(c)$  is exactly the cocycle of [Theorem 16](#), where we have abstracted away everything about  $A$ . We will rigorize this notion in our proof of [Theorem 27](#).

### 3.3 Tuples via Cohomology

We continue in the set-up of the previous subsection. The goal of this subsection is to prove [Lemma 26](#). The main idea is that we will be able to finitely generate  $\ker \mathcal{F}$  essentially using the relations of a  $\{\sigma_i\}_{i=1}^m$ -tuple.

## A Verification of the Cocycle

In this section, we verify [Theorem 16](#). As such, in this section, we will work under the modified set-up, forgetting about the extension  $\mathcal{E}$  but letting  $(\{\alpha_i\}, \{\beta_{ij}\})$  be some  $\{\sigma_i\}_{i=1}^m$ -tuple.

Here the formula looks like

$$c(g, g') := \left[ \prod_{1 \leq j < i \leq m} \left( \prod_{1 \leq k < j} \sigma_k^{a_k + b_k} \right) \left( \prod_{j \leq k < i} \sigma_k^{a_k} \right) \beta_{ij}^{(a_i b_j)} \right] \left[ \prod_{i=1}^m \left( \prod_{1 \leq k < i} \sigma_k^{a_k + b_k} \right) \alpha_i^{\lfloor \frac{a_i + b_i}{n_i} \rfloor} \right],$$

where  $g = \prod_i \sigma_i^{a_i}$  and  $g' = \prod_i \sigma_i^{b_i}$  with  $0 \leq a_i, b_i < n_i$  and  $q_i := \lfloor (a_i + b_i)/n_i \rfloor$ . To make this more digestible, we define

$$g_i := \prod_{1 \leq k < i} \sigma_k^{a_k}$$

for any  $g = \prod_i \sigma_i^{a_i} \in G$ , so we can write down our formula as

$$c(g, g') := \left[ \prod_{1 \leq j < i \leq m} g_i g'_j \beta_{ij}^{(a_i b_j)} \right] \left[ \prod_{i=1}^m g_i g'_i \alpha_i^{\lfloor \frac{a_i + b_i}{n_i} \rfloor} \right].$$

Now, given  $g, g', g'' \in G$ , we would like to check

$$gc(g', g'') \cdot c(g, g'g'') \stackrel{?}{=} c(gg', g'') \cdot c(g, g'),$$

where  $g = \prod_i \sigma_i^{a_i}$  and  $g' = \prod_i \sigma_i^{b_i}$  and  $g'' = \prod_i \sigma_i^{c_i}$  with  $0 \leq a_i, b_i, c_i < n_i$ .

### A.1 Carries

We will begin our verification by dealing with carries; we start with the following lemma, intended to beef up our relation [\(2.2\)](#).

**Lemma 31.** Given indices  $i > j$  with  $a_i, a_j, q_i, q_j \geq 0$ , we have

$$\beta_{ij}^{(a_i a_j)} = \beta_{ij}^{(a_i + q_i n_i, a_j)} \left( \frac{\sigma_j^{a_j}(\alpha_i)}{\alpha_i} \right)^{q_i} \quad \text{and} \quad \beta_{ij}^{(a_i a_j)} = \beta_{ij}^{(a_i, a_j + q_j n_j)} \left( \frac{\alpha_j}{\sigma_i^{a_i}(\alpha_j)} \right)^{q_j}.$$

*Proof.* This is a matter of force. For one, we compute

$$\begin{aligned} \beta_{ij}^{(a_i + n_i q_i, a_j)} &= \prod_{p=0}^{a_i + n_i q_i - 1} \prod_{q=0}^{a_j - 1} \sigma_i^p \sigma_j^q \beta_{ij} \\ &= \left( \prod_{p=0}^{a_i - 1} \prod_{q=0}^{a_j - 1} \sigma_i^p \sigma_j^q \beta_{ij} \right) \left( \prod_{q=0}^{a_j - 1} \prod_{p=a_i}^{a_i + n_i q_i - 1} \sigma_i^p \sigma_j^q \beta_{ij} \right) \\ &= \beta_{ij}^{(a_i a_j)} \left( \prod_{q=0}^{a_j - 1} \sigma_j^q N_{L/L_i}(\beta_{ij}) \right)^{q_i}. \end{aligned}$$

Now, using the relation  $N_{L/L_i}(\beta_{ij}) = \alpha_i / \sigma_j(\alpha_i)$  from [\(2.2\)](#), this becomes

$$\begin{aligned} \beta_{ij}^{(a_i + n_i q_i, a_j)} &= \beta_{ij}^{(a_i a_j)} \left( \prod_{q=0}^{a_j - 1} \frac{\sigma_j^q \alpha_i}{\sigma_j^{q+1} \alpha_i} \right)^{q_i} \\ &= \beta_{ij}^{(a_i a_j)} \left( \frac{\alpha_i}{\sigma^{a_j} \alpha_i} \right)^{q_i}, \end{aligned}$$

which rearranges into what we wanted.

For the other, we again just compute

$$\begin{aligned}
 \beta_{ij}^{(a_i, a_j + n_j q_j)} &= \prod_{p=0}^{a_i-1} \prod_{q=0}^{a_j + n_j q_j - 1} \sigma_i^p \sigma_j^q \beta_{ij} \\
 &= \left( \prod_{p=0}^{a_i-1} \prod_{q=0}^{a_j-1} \sigma_i^p \sigma_j^q \beta_{ij} \right) \left( \prod_{p=0}^{a_i-1} \prod_{q=q_j}^{a_j + n_j q_j - 1} \sigma_i^p \sigma_j^q \beta_{ij} \right) \\
 &= \beta_{ij}^{(a_i a_j)} \left( \prod_{p=0}^{a_i-1} \sigma_i^p N_{L/L_q}(\beta_{ij}) \right)^{q_i}.
 \end{aligned}$$

This time, we use the relation  $N_{L/L_j}(\beta_{ij}) = \sigma_i(\alpha_j)/\alpha_j$ , which gives

$$\begin{aligned}
 \beta_{ij}^{(a_i, a_j + n_j q_j)} &= \beta_{ij}^{(a_i a_j)} \left( \prod_{p=0}^{a_i-1} \frac{\sigma_i^{p+1}(\alpha_j)}{\sigma_i^p(\alpha_j)} \right)^{q_i} \\
 &= \beta_{ij}^{(a_i a_j)} \left( \frac{\sigma_i^{a_j}(\alpha_j)}{\alpha_j} \right)^{q_i},
 \end{aligned}$$

which again rearranges into the desired. ■

We are now ready to begin the computation, dealing with carries to start. Use the division algorithm to write

$$a_i + b_i = n_i u_i + x_i \quad \text{and} \quad b_i + c_i = n_i v_i + y_i,$$

where  $u_i, v_i \in \{0, 1\}$  and  $0 \leq x_i, y_i < n_i$  for each  $i$ . We start by collecting remainder terms on the side of  $gc(g', g'') \cdot c(g, g' g'')$ .

1. Note

$$gc(g', g'') = g \left[ \prod_{1 \leq j < i \leq m} g'_i g''_j \beta_{ij}^{(b_i c_j)} \right] \cdot g \left[ \prod_{i=1}^m g'_i g''_i \alpha_i^{v_i} \right],$$

so we set

$$R_1 := \prod_{i=1}^m g g'_i g''_i \alpha_i^{v_i}$$

to be our remainder term.

2. Note

$$\begin{aligned}
 c(g, g' g'') &= \left[ \prod_{1 \leq j < i \leq m} g_i g'_j g''_j \beta_{ij}^{(a_i y_j)} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{a_i + y_i}{n_i} \rfloor} \right] \\
 &= \left[ \prod_{1 \leq j < i \leq m} g_i g'_j g''_j \beta_{ij}^{(a_i, b_j + c_j)} \cdot g_i g'_j g''_j \left( \frac{\alpha_j}{\sigma_i^{a_i} \alpha_j} \right)^{v_i} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{a_i + y_i}{n_i} \rfloor} \right] \\
 &= \left[ \prod_{1 \leq j < i \leq m} g_i g'_j g''_j \beta_{ij}^{(a_i, b_j + c_j)} \right] \left[ \prod_{1 \leq j < i \leq m} g_i g'_j g''_j \left( \frac{\alpha_j}{\sigma_i^{a_i} \alpha_j} \right)^{v_i} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{a_i + y_i}{n_i} \rfloor} \right],
 \end{aligned}$$

so we set

$$R_2 := \left[ \prod_{1 \leq j < i \leq m} g_i g'_j g''_j \left( \frac{\alpha_j}{\sigma_i^{a_i} \alpha_j} \right)^{v_i} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{a_i + y_i}{n_i} \rfloor} \right]$$

to be our remainder term.

3. Lastly, we collect our remainders. Observe

$$\begin{aligned}
 R_2 &= \left[ \prod_{j=1}^m g'_j g''_j \left( \prod_{i=j+1}^m g_i \cdot \frac{\alpha_j}{\sigma_i^{a_i} \alpha_j} \right)^{v_i} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{a_i + y_i}{n_i} \rfloor} \right] \\
 &= \left[ \prod_{j=1}^m g'_j g''_j \left( \prod_{i=j+1}^m \frac{(\sigma_1^{a_1} \cdots \sigma_{i-1}^{a_{i-1}}) \alpha_j}{(\sigma_1^{a_1} \cdots \sigma_{i-1}^{a_{i-1}}) \sigma_i^{a_i} \alpha_j} \right)^{v_i} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{a_i + y_i}{n_i} \rfloor} \right] \\
 &= \left[ \prod_{j=1}^m g'_j g''_j \left( \prod_{i=j+1}^m \frac{g_i \alpha_j}{g_{i+1} \alpha_j} \right)^{v_i} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{a_i + y_i}{n_i} \rfloor} \right] \\
 &= \left[ \prod_{j=1}^m g'_j g''_j \cdot \frac{g_{j+1} \alpha_j^{v_j}}{g \alpha_j^{v_j}} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{a_i + y_i}{n_i} \rfloor} \right].
 \end{aligned}$$

We now note that  $g_{j+1} \alpha_j = g_j \alpha_j$  because  $\alpha_j$  is fixed by  $\sigma_j$ . As such,

$$\begin{aligned}
 R_1 R_2 &= \left[ \prod_{i=1}^m g g'_i g''_i \alpha_i^{v_i} \right] \left[ \prod_{i=1}^m g'_i g''_i \cdot \frac{g_i \alpha_i^{v_i}}{g \alpha_i^{v_i}} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{a_i + y_i}{n_i} \rfloor} \right] \\
 &= \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{v_i + \lfloor \frac{a_i + y_i}{n_i} \rfloor},
 \end{aligned}$$

which is nice enough for us now.

Now, we collect remainder terms from  $c(gg', g'') \cdot c(g, g')$ .

1. Note

$$\begin{aligned}
 c(gg', g'') &= \left[ \prod_{1 \leq j < i \leq m} g_i g'_i g''_j \beta_{ij}^{(x_i c_j)} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{x_i + c_i}{n_i} \rfloor} \right] \\
 &= \left[ \prod_{1 \leq j < i \leq m} g_i g'_i g''_j \beta_{ij}^{(a_i + b_i, c_j)} \cdot g_i g'_i g''_j \left( \frac{\sigma_j^{c_j} \alpha_i}{\alpha_i} \right)^{u_i} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{x_i + c_i}{n_i} \rfloor} \right] \\
 &= \left[ \prod_{1 \leq j < i \leq m} g_i g'_i g''_j \beta_{ij}^{(a_i + b_i, c_j)} \right] \left[ \prod_{1 \leq j < i \leq m} g_i g'_i g''_j \left( \frac{\sigma_j^{c_j} \alpha_i}{\alpha_i} \right)^{u_i} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{x_i + c_i}{n_i} \rfloor} \right],
 \end{aligned}$$

so we set

$$R_3 := \left[ \prod_{1 \leq j < i \leq m} g_i g'_i g''_j \left( \frac{\sigma_j^{c_j} \alpha_i}{\alpha_i} \right)^{u_i} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{x_i + c_i}{n_i} \rfloor} \right].$$

2. Note

$$c(g, g') = \left[ \prod_{1 \leq j < i \leq m} g_i g'_j \beta_{ij}^{(a_i b_j)} \right] \left[ \prod_{i=1}^m g_i g'_i \alpha_i^{u_i} \right],$$

so we set

$$R_4 := \left[ \prod_{i=1}^m g_i g'_i \alpha_i^{u_i} \right].$$

3. Lastly, we collect our remainder terms. Observe

$$\begin{aligned}
 R_3 &= \left[ \prod_{i=1}^m g_i g'_i \left( \prod_{j=1}^{i-1} g''_j \cdot \frac{\sigma_j^{c_j} \alpha_i}{\alpha_i} \right)^{u_i} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{x_i + c_i}{n_i} \rfloor} \right] \\
 &= \left[ \prod_{i=1}^m g_i g'_i \left( \prod_{j=1}^{i-1} \frac{(\sigma_1^{c_1} \cdots \sigma_{j-1}^{c_{j-1}}) \sigma_j^{c_j} \alpha_i}{(\sigma_1^{c_1} \cdots \sigma_{j-1}^{c_{j-1}}) \alpha_i} \right)^{u_i} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{x_i + c_i}{n_i} \rfloor} \right] \\
 &= \left[ \prod_{i=1}^m g_i g'_i \left( \prod_{j=1}^{i-1} \frac{g''_{j+1} \alpha_i}{g''_j \alpha_i} \right)^{u_i} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{x_i + c_i}{n_i} \rfloor} \right] \\
 &= \left[ \prod_{i=1}^m g_i g'_i \cdot \frac{g''_i \alpha_i^{u_i}}{\alpha_i^{u_i}} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{x_i + c_i}{n_i} \rfloor} \right].
 \end{aligned}$$

Thus,

$$\begin{aligned}
 R_3 R_4 &= \left[ \prod_{i=1}^m g_i g'_i \cdot \frac{g''_i \alpha_i^{u_i}}{\alpha_i^{u_i}} \right] \left[ \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{\lfloor \frac{x_i + c_i}{n_i} \rfloor} \right] \left[ \prod_{i=1}^m g_i g'_i \alpha_i^{u_i} \right] \\
 &= \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{u_i + \lfloor \frac{x_i + c_i}{n_i} \rfloor},
 \end{aligned}$$

which is again simple enough for our purposes.

We now note that, for each  $i$ ,

$$u_i + \left\lfloor \frac{x_i + c_i}{n_i} \right\rfloor = \left\lfloor \frac{a_i + b_i + c_i}{n_i} \right\rfloor = v_i + \left\lfloor \frac{a_i + y_i}{n_i} \right\rfloor$$

by how carried addition behaves. It follows that

$$R_1 R_2 = \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{v_i + \lfloor \frac{a_i + y_i}{n_i} \rfloor} = \prod_{i=1}^m g_i g'_i g''_i \alpha_i^{u_i + \lfloor \frac{x_i + c_i}{n_i} \rfloor} = R_3 R_4.$$

Thus, it suffices to show that

$$\frac{g c(g', g'')}{R_1} \cdot \frac{c(g, g'')}{R_2} \stackrel{?}{=} \frac{c(g g', g'')}{R_3} \cdot \frac{c(g, g')}{R_4},$$

which is equivalent to

$$g \left[ \prod_{1 \leq j < i \leq m} g'_i g''_j \beta_{ij}^{(b_i c_j)} \right] \cdot \left[ \prod_{1 \leq j < i \leq m} g_i g'_j g''_j \beta_{ij}^{(a_i, b_j + c_j)} \right] \stackrel{?}{=} \left[ \prod_{1 \leq j < i \leq m} g_i g'_i g''_j \beta_{ij}^{(a_i + b_i, c_j)} \right] \cdot \left[ \prod_{1 \leq j < i \leq m} g_i g'_j \beta_{ij}^{(a_i b_j)} \right]$$

by the work above.

## A.2 Finishing

We need to verify that

$$g \left[ \prod_{1 \leq j < i \leq m} g'_i g''_j \beta_{ij}^{(b_i c_j)} \right] \cdot \left[ \prod_{1 \leq j < i \leq m} g_i g'_j g''_j \beta_{ij}^{(a_i, b_j + c_j)} \right] \stackrel{?}{=} \left[ \prod_{1 \leq j < i \leq m} g_i g'_i g''_j \beta_{ij}^{(a_i + b_i, c_j)} \right] \cdot \left[ \prod_{1 \leq j < i \leq m} g_i g'_j \beta_{ij}^{(a_i b_j)} \right]$$

as discussed in the previous subsection.

Before beginning the check, we recall the relations on the  $\beta$ s from (2.3) can be written as

$$\frac{\sigma_2(\beta_{31})}{\beta_{31}} = \frac{\sigma_1(\beta_{32})}{\beta_{32}} \cdot \frac{\sigma_3(\beta_{21})}{\beta_{21}},$$

because we only have one triple  $(i, j, k)$  of indices with  $i > j > k$ . This is somewhat difficult to deal with directly, so we quickly show a more general version.

**Lemma 32.** Fix indices with  $i > j > k$ , and let  $a_i, a_j, a_k \geq 0$ . Then

$$\frac{\sigma_j^{a_j} \beta_{ik}^{(a_i a_k)}}{\beta_{ik}^{(a_i a_k)}} = \frac{\sigma_k^{a_k} \beta_{ij}^{(a_i a_j)}}{\beta_{ij}^{(a_i a_j)}} \cdot \frac{\sigma_i^{a_i} \beta_{jk}^{(a_j a_k)}}{\beta_{jk}^{(a_j a_k)}}.$$

*Proof.* We simply compute

$$\begin{aligned} \frac{\sigma_i^{a_i} \beta_{jk}^{(a_j a_k)}}{\beta_{jk}^{(a_j a_k)}} \cdot \frac{\sigma_k^{a_k} \beta_{ij}^{(a_i a_j)}}{\beta_{ij}^{(a_i a_j)}} &= \prod_{r=0}^{a_i-1} \frac{\sigma_i^{r+1} \beta_{jk}^{(a_j a_k)}}{\sigma_i^r \beta_{jk}^{(a_j a_k)}} \cdot \prod_{p=0}^{a_k-1} \frac{\sigma_k^{p+1} \beta_{ij}^{(a_i a_j)}}{\sigma_k^p \beta_{ij}^{(a_i a_j)}} \\ &= \prod_{p=0}^{a_k-1} \prod_{q=0}^{a_j-1} \prod_{r=0}^{a_i-1} \left( \frac{\sigma_k^p \sigma_j^q \sigma_i^{r+1} \beta_{jk}}{\sigma_k^p \sigma_j^q \sigma_i^r \beta_{jk}} \cdot \frac{\sigma_k^{p+1} \sigma_j^q \sigma_i^r \beta_{ij}}{\sigma_k^p \sigma_j^q \sigma_i^r \beta_{ij}} \right) \\ &= \prod_{p=0}^{a_k-1} \prod_{q=0}^{a_j-1} \prod_{r=0}^{a_i-1} \sigma_k^p \sigma_j^q \sigma_i^r \left( \frac{\sigma_i \beta_{jk}}{\beta_{jk}} \cdot \frac{\sigma_k \beta_{ij}}{\beta_{ij}} \right) \\ &= \prod_{p=0}^{a_k-1} \prod_{q=0}^{a_j-1} \prod_{r=0}^{a_i-1} \sigma_k^p \sigma_j^q \sigma_i^r \left( \frac{\sigma_j \beta_{ik}}{\beta_{ik}} \right), \end{aligned}$$

where in the last equality we have use the relation on the  $\beta$ s. Continuing,

$$\begin{aligned} \frac{\sigma_i^{a_i} \beta_{jk}^{(a_j a_k)}}{\beta_{jk}^{(a_j a_k)}} \cdot \frac{\sigma_k^{a_k} \beta_{ij}^{(a_i a_j)}}{\beta_{ij}^{(a_i a_j)}} &= \prod_{q=0}^{a_j-1} \left( \prod_{p=0}^{a_k-1} \prod_{r=0}^{a_i-1} \frac{\sigma_j^{q+1} \sigma_k^p \sigma_i^r \beta_{ik}}{\sigma_j^q \sigma_k^p \sigma_i^r \beta_{ik}} \right) \\ &= \prod_{q=0}^{a_j-1} \frac{\sigma_j^{q+1} \beta_{ik}^{(a_i a_k)}}{\sigma_j^q \beta_{ik}^{(a_i a_k)}} \\ &= \frac{\sigma_j^{a_j} \beta_{ik}^{(a_i a_k)}}{\beta_{ik}^{(a_i a_k)}}, \end{aligned}$$

which is what we wanted. ■

We now proceed with the check, by induction. More precisely, we claim that any  $m' \leq m$  gives

$$g_{m'+1} \left[ \prod_{j < i \leq m'} g'_i g''_j \beta_{ij}^{(b_i c_j)} \right] \left[ \prod_{j < i \leq m'} g_i g'_j g''_j \beta_{ij}^{(a_i, b_j + c_j)} \right] \stackrel{?}{=} \left[ \prod_{j < i \leq m'} g_i g'_i g''_j \beta_{ij}^{(a_i + b_i, c_j)} \right] \left[ \prod_{j < i \leq m'} g_i g'_j \beta_{ij}^{(a_i b_j)} \right]$$

which we will show by induction on  $m'$ . For  $m' = 1$ , there is nothing to say because there are no indices  $i > j$ .

So now suppose we have equality for  $m' < m$ , and we give equality for  $m'' := m' + 1$ . That is, we want to show that

$$g_{m'+2} \prod_{j < i \leq m'+1} g'_i g''_j \beta_{ij}^{(b_i c_j)} \cdot \prod_{j < i \leq m'+1} g_i g'_j g''_j \beta_{ij}^{(a_i, b_j + c_j)} \stackrel{?}{=} \prod_{j < i \leq m'+1} g_i g'_i g''_j \beta_{ij}^{(a_i + b_i, c_j)} \cdot \prod_{j < i \leq m'+1} g_i g'_j \beta_{ij}^{(a_i b_j)}$$

but by the inductive hypothesis it suffices for

$$\frac{g_{m''+1} \prod_{j < i \leq m'+1} g'_i g''_j \beta_{ij}^{(b_i c_j)}}{g_{m'+1} \prod_{j < i \leq m'} g'_i g''_j \beta_{ij}^{(b_i c_j)}} \cdot \frac{\prod_{j < i \leq m'+1} g_i g'_j g''_j \beta_{ij}^{(a_i, b_j + c_j)}}{\prod_{j < i \leq m'} g_i g'_j g''_j \beta_{ij}^{(a_i, b_j + c_j)}} \stackrel{?}{=} \frac{\prod_{j < i \leq m'+1} g_i g'_i g''_j \beta_{ij}^{(a_i + b_i, c_j)}}{\prod_{j < i \leq m'} g_i g'_i g''_j \beta_{ij}^{(a_i + b_i, c_j)}} \cdot \frac{\prod_{j < i \leq m'+1} g_i g'_j \beta_{ij}^{(a_i b_j)}}{\prod_{j < i \leq m'} g_i g'_j \beta_{ij}^{(a_i b_j)}}$$

which collapses to

$$\frac{g_{m''+1} \prod_{j < i \leq m'+1} g'_i g''_j \beta_{ij}^{(b_i c_j)}}{g_{m'+1} \prod_{j < i \leq m'} g'_i g''_j \beta_{ij}^{(b_i c_j)}} \cdot \prod_{j \leq m'} g_{m''} g'_j g''_j \beta_{m''j}^{(a_{m''}, b_j + c_j)} \stackrel{?}{=} \prod_{j \leq m'} g_{m''} g'_{m''} g''_j \beta_{m''j}^{(a_{m''} + b_{m''}, c_j)} \cdot \prod_{j \leq m'} g_{m''} g'_j \beta_{m''j}^{(a_{m''} b_j)}$$

because the terms with  $i < m'' = m' + 1$  got cancelled in the rightmost three products. Rearranging, this is the same as

$$\frac{g_{m''+1} \prod_{j < i \leq m'+1} g'_i g''_j \beta_{ij}^{(b_i c_j)}}{g_{m'+1} \prod_{j < i \leq m'} g'_i g''_j \beta_{ij}^{(b_i c_j)}} \stackrel{?}{=} \frac{\prod_{j < m''} g_{m''} g'_{m''} g''_j \beta_{m''j}^{(a_{m''} + b_{m''}, c_j)} \cdot \prod_{j < m''} g_{m''} g'_j \beta_{m''j}^{(a_{m''} b_j)}}{\prod_{j < m''} g_{m''} g'_j g''_j \beta_{m''j}^{(a_{m''}, b_j + c_j)}}.$$

Peeling off the  $i = m'' = m' + 1$  terms from the left-hand side numerator, we're showing

$$\frac{g_{m''+1} \prod_{j < i \leq m'} g'_i g''_j \beta_{ij}^{(b_i c_j)}}{g_{m'+1} \prod_{j < i \leq m'} g'_i g''_j \beta_{ij}^{(b_i c_j)}} \stackrel{?}{=} \frac{\prod_{j < m''} g_{m''} g'_{m''} g''_j \beta_{m''j}^{(a_{m''} + b_{m''}, c_j)} \cdot \prod_{j < m''} g_{m''} g'_j \beta_{m''j}^{(a_{m''} b_j)}}{\prod_{j < m''} g_{m''+1} g'_{m''} g''_j \beta_{m''j}^{(b_{m''}, c_j)} \cdot \prod_{j < m''} g_{m''} g'_j g''_j \beta_{m''j}^{(a_{m''}, b_j + c_j)}}.$$

We take a moment to simplify the left-hand side with [Lemma 32](#) by writing

$$\begin{aligned} g_{m'+1} \prod_{j < i \leq m'} g'_i g''_j \left( \frac{\sigma_{m''}^{a_{m''}} \beta_{ij}^{(b_i c_j)}}{\beta_{ij}^{(b_i c_j)}} \right) &= g_{m''} \prod_{j < i \leq m'} g'_i g''_j \left( \frac{\sigma_i^{b_i} \beta_{m''j}^{(a_{m''} c_j)}}{\beta_{m''j}^{(a_{m''} c_j)}} \cdot \frac{\beta_{m''i}^{(a_{m''} b_i)}}{\sigma_j^{c_j} \beta_{m''i}^{(a_{m''} b_i)}} \right) \\ &= g_{m''} \left[ \prod_{j=1}^{m'} g''_j \prod_{i=j+1}^{m'} g'_i \left( \frac{\sigma_i^{b_i} \beta_{m''j}^{(a_{m''} c_j)}}{\beta_{m''j}^{(a_{m''} c_j)}} \right) \cdot \prod_{i=1}^{m'} g'_i \prod_{j=1}^{i-1} g''_j \left( \frac{\beta_{m''i}^{(a_{m''} b_i)}}{\sigma_j^{c_j} \beta_{m''i}^{(a_{m''} b_i)}} \right) \right] \\ &= g_{m''} \left[ \prod_{j=1}^{m'} \frac{g'_{m'+1} g''_j \beta_{m''j}^{(a_{m''} c_j)}}{g'_{j+1} g''_j \beta_{m''j}^{(a_{m''} c_j)}} \cdot \prod_{i=1}^{m'} \frac{g'_i \beta_{m''i}^{(a_{m''} b_i)}}{g'_i g''_i \beta_{m''i}^{(a_{m''} b_i)}} \right] \\ &= g_{m''} \left[ \prod_{j < m''} \frac{g'_{m''} g''_j \beta_{m''j}^{(a_{m''} c_j)}}{g'_{j+1} g''_j \beta_{m''j}^{(a_{m''} c_j)}} \cdot \prod_{j < m''} \frac{g'_j \beta_{m''j}^{(a_{m''} b_j)}}{g'_j g''_j \beta_{m''j}^{(a_{m''} b_j)}} \right] \end{aligned}$$

after doing a lot of telescoping. Now, we can remove  $g_{m''}$  everywhere to give

$$\prod_{j < m''} \frac{g'_{m''} g''_j \beta_{m''j}^{(a_{m''} c_j)}}{g'_{j+1} g''_j \beta_{m''j}^{(a_{m''} c_j)}} \cdot \prod_{j < m''} \frac{g'_j \beta_{m''j}^{(a_{m''} b_j)}}{g'_j g''_j \beta_{m''j}^{(a_{m''} b_j)}} \stackrel{?}{=} \frac{\prod_{j < m''} g'_{m''} g''_j \beta_{m''j}^{(a_{m''} + b_{m''}, c_j)} \cdot \prod_{j < m''} g'_j \beta_{m''j}^{(a_{m''} b_j)}}{\prod_{j < m''} g'_{m''+1} g''_j \beta_{m''j}^{(b_{m''}, c_j)} \cdot \prod_{j < m''} g'_j g''_j \beta_{m''j}^{(a_{m''}, b_j + c_j)}},$$

or

$$\prod_{j < m''} \frac{g'_{m''} g''_j \beta_{m''j}^{(a_{m''} c_j)}}{g'_{j+1} g''_j \beta_{m''j}^{(a_{m''} c_j)}} \stackrel{?}{=} \frac{\prod_{j < m''} g'_{m''} g''_j \beta_{m''j}^{(a_{m''} + b_{m''}, c_j)} \cdot \prod_{j < m''} g'_j g''_j \beta_{m''j}^{(a_{m''} b_j)}}{\prod_{j < m''} g'_{m''+1} g''_j \beta_{m''j}^{(b_{m''}, c_j)} \cdot \prod_{j < m''} g'_j g''_j \beta_{m''j}^{(a_{m''}, b_j + c_j)}}.$$

Rearranging, we want

$$\prod_{j < m''} \frac{g'_j g''_j \beta_{m''j}^{(a_{m''}, b_j + c_j)}}{g'_j g''_j \beta_{m''j}^{(a_{m''}, b_j)} \cdot g'_{j+1} g''_j \beta_{m''j}^{(a_{m''}, c_j)}} \stackrel{?}{=} \prod_{j < m''} \frac{g'_{m''} g''_j \beta_{m''j}^{(a_{m''} + b_{m''}, c_j)}}{g'_{m''} g''_j \beta_{m''j}^{(a_{m''}, c_j)} \cdot g'_{m''+1} g''_j \beta_{m''j}^{(b_{m''}, c_j)}},$$

which is

$$\prod_{j < m''} g'_j g''_j \left( \frac{\beta_{m''j}^{(a_{m''}, b_j + c_j)}}{\beta_{m''j}^{(a_{m''}, b_j)} \cdot \sigma_j^{b_j} \beta_{m''j}^{(a_{m''}, c_j)}} \right) \stackrel{?}{=} \prod_{j < m''} g'_{m''} g''_j \left( \frac{\beta_{m''j}^{(a_{m''} + b_{m''}, c_j)}}{\beta_{m''j}^{(a_{m''}, c_j)} \cdot \sigma_{m''}^{a_{m''}} \beta_{m''j}^{(b_{m''}, c_j)}} \right).$$

However, by definition of the  $\beta_{ij}^{(xy)}$ , we see that

$$\frac{\beta_{m''j}^{(a_{m''}, b_j + c_j)}}{\beta_{m''j}^{(a_{m''}, b_j)} \cdot \sigma_j^{b_j} \beta_{m''j}^{(a_{m''}, c_j)}} = \frac{\beta_{m''j}^{(a_{m''} + b_{m''}, c_j)}}{\beta_{m''j}^{(a_{m''}, c_j)} \cdot \sigma_{m''}^{a_{m''}} \beta_{m''j}^{(b_{m''}, c_j)}} = 1,$$

so everything does indeed cancel out properly. This completes the check.
